3.1.1. Numpy Array Operations

Write a Python program to create a NumPy array based on user input and display the following:

- The created NumPy array.
- The number of dimensions of the array using `ndim`
- The shape of the array using `shape`
- The total number of elements in the array using `size`

Assume all input elements are valid integers.

Input Format:

- The first line contains two space-separated integers, `rows` and `columns`, representing the number of rows and the number of columns.
- The next `rows` lines contain `columns` space-separated integers representing the elements of the array, entered row by row.

Output Format:

- The created NumPy array (printed as a 2D array).
- An integer representing the number of dimensions of the array.
- A tuple representing the shape of the array.
- An integer representing the total number of elements in the array.

Note: Use `reshape()` function to reshape the input array with the specified number of rows and columns.

```

CODE: import numpy as np
rows, cols = map(int, input().split())
elements = []
for _ in range(rows):
    elements.extend(map(int, input().split()))
array = np.array(elements).reshape(rows, cols)
print(array)
print(array.ndim)
print(array.shape)
print(array.size)

```

Lab Assignment

3.2.1. Numpy: Matrix Operations

The given code takes two matrices, A and B , as input from the user and converts them into NumPy arrays.

Task:

You are required to compute and display the results of the following matrix operations:

1. Addition ($A + B$)
2. Subtraction ($A - B$)
3. Element-wise Multiplication ($A * B$)
4. Matrix Multiplication ($A @ B$)
5. Transpose of Matrix A

Input Format:

- The user will input 3 rows for A , each containing 3 integers separated by spaces.
- Similarly, the user will input 3 rows for B , each containing 3 integers separated by spaces.

Output Format:

The program should display the results of the operations in the following order:

1. The result of Addition.
2. The result of Subtraction.
3. The result of Element-wise Multiplication.
4. The result of Matrix Multiplication.
5. The Transpose of Matrix A.

CODE:

```
import numpy as np

# Input matrices
print("Enter Matrix A:")
matrix_a = np.array([list(map(int, input().split()))
                      for i in range(3)])
print("Enter Matrix B:")
matrix_b = np.array([list(map(int, input().split())) for i in range(3)])

# Addition
addition_result = matrix_a + matrix_b
print("Addition (A + B):") print(addition_result)

# Subtraction
subtraction_result = matrix_a - matrix_b
print("Subtraction (A - B):")
print(subtraction_result)

# Multiplication (element-wise)
elementwise_multiplication_result
= matrix_a * matrix_b print("Element-wise Multiplication (A *
B):") print(elementwise_multiplication_result)

# Matrix multiplication (dot product)
matrix_multiplication_result = np.dot(matrix_a, matrix_b) print("A dot B:")
print(matrix_multiplication_result)

# Transpose
transpose_a = matrix_a.T
print("Transpose of A:") print(transpose_a)
```

3.2.2. Numpy: Horizontal and Vertical Stacking of Arrays

08:24

You are given two arrays arr1 and arr2. You need to perform horizontal and vertical stacking operations on them using NumPy.

- Horizontal Stacking: Stack the two matrices horizontally (side by side).
- Vertical Stacking: Stack the two matrices vertically (one below the other).

Input Format:

- The program should first prompt the user to input two 3x3 arrays.
- Each array consists of 3 rows, and each row contains 3 space-separated integers.
- The user will input the two arrays row by row.

Output Format:

- The program should display the result of the Horizontal Stack (side-by-side stacking) of the two arrays.

- The program should then display the result of the Vertical Stack (one below the other) of the two arrays.

```
import numpy as np

# Input matrices print("Enter Array1:") arr1 =
np.array([list(map(int, input().split())) for i in range(3)])
print("Enter Array2:") arr2 = np.array([list(map(int, input().split())) for i in range(3)])

# Perform horizontal stacking
(hstack) a=np.hstack((arr1,arr2)) print("Horizontal Stack:") print(a)

# Perform vertical stacking (vstack)
b=np.vstack((arr1,arr2))
print("Vertical Stack:") print(b)
```

3.2.3. Numpy: Custom Sequence Generation

Write a Python program that takes the following inputs from the user:

- Start value: The starting point of the sequence.
- Stop value: The sequence should end before this value.
- Step value: The increment between each number in the sequence.

The program should then generate a sequence using numpy based on these inputs and print the generated sequence.

Input Format:

- The user will input three integer values: start, stop, and step, each on a new line.

Output Format:

- The program should print the generated sequence based on the input values.

```
import numpy as np
```

```
# Take user input for the start, stop, and step of the sequence
```

```
start = int(input()) stop = int(input()) step = int(input())
```

```
# Generate the sequence using np.arange() n=np.arange(start,stop, step)
```

```
# Print the generated sequence print(n)
```

The screenshot displays the execution results of a Python program. At the top, performance metrics are shown: Average time 0.058 s (57.75 ms) and Maximum time 0.146 s (146.00 ms). Test results indicate that 2 out of 2 shown test case(s) passed and 2 out of 2 hidden test case(s) passed. Below this, two test cases are detailed. Test case 1, with a duration of 146 ms, shows an expected output of 3, 10, 2, and [3 5 7 9], which matches the actual output. Test case 2, with a duration of 20 ms, shows an expected output of 10, 20, 30, and [10], which also matches the actual output. Each test case entry includes a 'Debug' button and icons for viewing the code and output.

Metric	Value
Average time	0.058 s (57.75 ms)
Maximum time	0.146 s (146.00 ms)

Test Results Summary:

- 2 out of 2 shown test case(s) passed
- 2 out of 2 hidden test case(s) passed

Test Case 1 (146 ms):

Expected output	Actual output
3	3
10	10
2	2
[3 5 7 9]	[3 5 7 9]

Test Case 2 (20 ms):

Expected output	Actual output
10	10
20	20
30	30
[10]	[10]

3.2.4. Numpy: Arithmetic and Statistical Operations, Mathematical Operations, Bitwise Operators

You are given two arrays A and B. Your task is to complete the function `array_operations`, which will convert these lists into NumPy arrays and perform the following operations:

1. Arithmetic Operations:

- Compute the element-wise sum, difference, and product of the two arrays.

2. Statistical Operations:

- Calculate the mean, median, and standard deviation of array A.

3. Bitwise Operations:

- Perform bitwise AND, bitwise OR, and bitwise XOR on the arrays (ex: $A_i \text{ OR } B_i$).

Input Format:

- The first line contains space-separated integers representing the elements of array A.
- The second line contains space-separated integers representing the elements of array B.

Output Format:

- For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as shown in sample test cases.

```
import numpy as np
```

```
def array_operations(A, B):
```

```
# Convert A and B to NumPy arrays
```

```
    A = np.array(A)
```

```
    B = np.array(B) # Arithmetic Operations sum_result = A + B
```

```
    diff_result = A - B prod_result = A * B
```

```
    # Statistical Operations
```

```
    mean_A = np.mean(A)
```

```
    median_A = np.median(A)
```

```
    std_dev_A = np.std(A)
```

```
    # Bitwise Operations
```

```
    and_result = A & B
```

```
    or_result = A | B
```

```
    xor_result = A ^ B
```

```

# Output results with one space between each element print("Elementwise
Sum:", ''.join(map(str, sum_result))) print("Element-wise Difference:", '
'.join(map(str, diff_result))) print("Element-wise Product:", ''.join(map(str,
prod_result)))

print(f"Mean of A: {mean_A}") print(f"Median of A:
{median_A}") print(f"Standard Deviation of A:
{std_dev_A}")

print("Bitwise AND:", ''.join(map(str, and_result))) print("Bitwise
OR:", ''.join(map(str, or_result))) print("Bitwise XOR:", '
'.join(map(str, xor_result)))

A = list(map(int, input().split()))
# Elements of array A B = list(map(int, input().split()))
# Elements of array B
array_operations(A, B)

```

3.2.5. Numpy: Copying and Viewing Arrays

04:23

The given code takes a list of integers as input and converts it into a NumPy array. Your task is to complete the code by:

- Creating a view of the original_array and assigning it to view_array. □ Creating a copy of the original_array and assigning it to copy_array.

After completing these steps, observe how modifying the view affects the original_array, while modifying the copy does not.

Input Format:

- A single line of space-separated integers.

Output Format:

- After modifying the view:

Original array after modifying view: <original_array>

View array: <view_array>

- After modifying the copy:

Original array after modifying copy: <original_array>

Copy array: <copy_array>

```
import numpy as np
```

```
inputlist = list(map(int,input().split(" ")))
```

```
# Original array original_array = np.array(inputlist)
```

```
# Create a view view_array =original_array.view()
```

```
# Create a copy
```

```
copy_array =original_array.copy()
```

```
# Modify the view
```

```
view_array[0] = 99
```

```
print("Original array after modifying view:", original_array)
```

```
print("View array:", view_array)
```

```
# Modify the copy copy_array[1] = 88 print("Original array
after modifying copy:", original_array) print("Copy array:",
copy_array)
```

3.2.6. Numpy: Searching, Sorting, Counting, Broadcasting

05:03

The given code in the editor takes a single array, array1, as space-separated integers as input from the user.

Additionally, it takes the following inputs:

- search_value: The value to search for in the array.
- count_value: The value to count its occurrences in the array.
- broadcast_value: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

1. Searching: Find the indices where search_value appears in array1 and print these indices.
2. Counting: Count how many times count_value appears in array1 and print the count.

3. Broadcasting: Add broadcast_value to each element of array1 using broadcasting, and print the resulting array.
4. Sorting: Sort array1 in ascending order and print the sorted array.

Input Format:

1. A single line containing space-separated integers representing array1.
2. An integer search_value represents the value to search for in the array.
3. An integer count_value represents the value to count in the array.
4. An integer broadcast_value represents the value to add to each element of the array.

Output Format:

1. The indices where search_value occurs in array1.
2. The count of occurrences of count_value in array1.
3. The array after adding the broadcast_value to each element.
4. The sorted array.

```
import numpy as np

# Input array from the user
array1 = np.array(list(map(int, input().split()))))

# Searching
search_value = int(input("Value to search: "))
count_value = int(input("Value to count: "))
broadcast_value = int(input("Value to add: "))

# Find indices where value matches in array1
a=np.where(array1==search_value)[0] print(a)

# Count occurrences in array1
b=np.count_nonzero(array1==count_value) print(b) # Broadcasting
addition c=array1 + broadcast_value print(c) # Sort the first array
d=np.sort(array1) print(d)
```

3.2.7. Student Data Analysis and Operations

31:34

Write a Python program that takes the file name of a CSV file containing student details, including roll numbers and their marks in three subjects as input, reads the data, and performs the following operations:

- Print all student details: Display the complete details of all students, including roll numbers and marks for all subjects.
- Find total students: Determine the total number of students in the dataset.
- Print all student roll numbers: Extract and print the roll numbers of all students.
- Print Subject 1 marks: Extract and print the marks of all students in Subject 1.
- Find minimum marks in Subject 2: Identify the lowest marks in Subject 2.
- Find maximum marks in Subject 3: Identify the highest marks in Subject 3.
- Print all subject marks: Display the marks of all students for each subject.
- Find total marks of students: Compute the total marks for each student across all subjects.
- Find the average marks of each student: Compute the average marks for each student.

- Find average marks of each subject: Compute the average marks for all students in each subject.
- Find average marks of Subject 1 and Subject 2: Compute the average marks for Subject 1 and Subject 2.
- Find average marks of Subject 1 and Subject 3: Compute the average marks for Subject 1 and Subject 3.
- Find the roll number of the student with maximum marks in Subject 3: Identify the student with the highest marks in Subject 3 and print their roll number.
- Find the roll number of the student with minimum marks in Subject 2: Identify the student with the lowest marks in Subject 2 and print their roll number.
- Find the roll number of students who scored 24 marks in Subject 2: Identify students who obtained exactly 24 marks in Subject 2 and print their roll numbers.
- Find the count of students who got less than 40 marks in Subject 1: Count the number of students who scored less than 40 marks in Subject 1.
- Find the count of students who got more than 90 marks in Subject 2: Count the number of students who scored more than 90 marks in Subject 2.
- Find the count of students who scored ≥ 90 in each subject: Count the number of students who scored 90 or more marks in each subject.
- Find the count of subjects in which each student scored ≥ 90 : Determine how many subjects each student scored 90 or more marks in.
- Print Subject 1 marks in ascending order: Sort and print the marks of students in Subject 1 in ascending order.
- Print students who scored between 50 and 90 in Subject 1: Display students who scored marks between 50 and 90 in Subject 1.
- Find index positions of students who scored 79 in Subject 1: Identify the index positions of students who scored exactly 79 marks in Subject 1.

Note: Fill in the missing code to perform the above-mentioned operations.

CODE:

```
import numpy as np
```

```
a = np.loadtxt("Sample.csv", delimiter=',', skiprows=1)
```

```

# 1. Print all student details print("All
student Details:\n", a )

# 2. print total students
print("Total Students:",len(a) )

# 3. Print all student Roll numbers print("All
Student Roll Nos", a[:,0] )

# 4. Print subject 1 marks
print("Subject 1 Marks", a[:,1])

# 5. print minimum marks of Subject 2
